

quarto-index demo

Supported forms

The four entry forms, each exercised at least once. The two cross-reference forms have their own section below.

Visible term. The word pandoc is indexed by its own text. Marking pandoc again, and a third time pandoc, adds further locators to the same entry.

Custom entry. This phrase stays visible but indexes under a different term.

Sub-entries. A nested term indexes three levels deep.

Invisible entry. This sentence carries a mark with no visible text.

Cross-references

A cross-reference sends the reader to another entry instead of listing a page. Keys here are deliberately distinct from the plain marks above: a term marked both ways can fail the index build, and the extension says so.

See. cats points elsewhere.

See also. dogs points elsewhere as well as here.

Multi-level target. owls points at a sub-entry.

Literal bang in a target. bang.

Cross-reference from a sub-entry. foxes.

Invisible cross-reference.

Both attributes on one mark, which warns and emits one entry carrying both targets: both.

Targets. Each target above names one of the entries marked below, so every cross-reference resolves. The marks carry no visible text, so this paragraph prints nothing after this sentence.

Level syntax probes

A literal exclamation mark is written `!!`.

Leading: lead. Medial: mid. Trailing: trail. Odd run: odd. Backslash level: `bslash`. Old spelling: old. Empty level: empty. Too deep: deep.

Escaping probes

Every character of the escape domain across visible terms. These are kept short so each fits one line of the two-column printed index: `pct % amp & hash #, us _ brace { }, bs \ tilde ~ caret ^, dollar $ at @ bar |, and bang ! quote "`.

The same characters in an `entry=` level: entry specials.

Leading and trailing specials in visible terms: `{Braced}` and `~tilde dollar$`.

Angle brackets, which Pandoc's own LaTeX writer escapes: `less < more >`.

Non-ASCII, which IP2 requires to appear correctly in the index: `café naïve` and `Grüße`.
